PURPOSE AND RESULTS OF THE SURVEY

The tables on farm housing presented herewith are based on selected data from the farm-housing survey, a house-to-house canvass of farm homes in selected rural counties carried on in January and February of 1934 under the direction of the Bureau of Home Economics.[1] The survey was designed to measure the potential demand for improved home facilities on farms. Tables 2 to 7 include data on 595,855 occupied farmhouses in 308 counties of 46 States, or 8.6 percent of the occupied farmhouses reported for the surveyed States in the Census of Agriculture for 1935.

Detailed information concerning the house, its equipment and needs for improvement, was entered on a schedule,[2] by women field workers under the supervision of the various State extension services. Tabulations were made in county offices and edited in the State offices, and again in Washington. Field tabulations from which data were used for the final tables were found to be accurate within 3 percent of the total number of entries when tested by means of sample tabulations made from the original schedules. The items from the schedule that are included in the tables were selected after careful editing of the field data and with the advice of the United States Central Statistical Board.

Sampling was on the basis of a 10-percent representation of the farm dwellings in each State. Table 1, comparing the number of houses surveyed in the various geographical divisions with the number of occupied dwellings reported by the 1935 Census of Agriculture for these divisions, shows that the sample obtained in all divisions, except the Middle Atlantic, is between 7 and 11 percent of the occupied farmhouses, and that slightly more than a 10-percent sample was obtained in the South Atlantic and Mountain divisions.

The counties or areas studied were selected by State committees appointed by the State directors of extension. Some of the factors entering into the selection of the areas to be studied were types of farming, physiographic features, average value of farm and farm dwelling, nationality of farm population, comparative numbers of owner and tenant operators, and the length of settlement.

TABLE 1.—*Comparison between number of occupied farm dwellings reported in the farm-housing survey and in the 1935 Census of Agriculture by geographic divisions*

Geographic division	Occupied farm dwellings reported		Census total covered by survey sample	Distribution of total occupied farm dwellings by geographic divisions	
	Survey sample	Census		Survey sample	Census
	Number	*Number*	*Percent*	*Percent*	*Percent*
New England	12,828	167,810	7.6	2.2	2.3
Middle Atlantic[1]	[1] 2,033	442,833	[1] .5	[1] .3	6.0
East North Central	83,808	1,165,086	7.2	14.1	15.8
West North Central	116,184	1,213,147	9.6	19.5	16.5
South Atlantic	131,847	1,304,436	10.1	22.1	17.7
East South Central	93,626	1,195,528	7.8	15.7	16.2
West South Central	96,548	1,241,573	7.8	16.2	16.9
Mountain	31,225	292,709	10.7	5.2	4.0
Pacific	27,756	337,090	8.2	4.7	4.6
Total, United States	595,855	7,360,212	8.1	100.0	100.0
Total, surveyed States	595,855	6,951,805	8.6	----------	----------

[1] New Jersey was the only State in the Middle Atlantic division entered by the survey.

A sample of this size should give a representative picture, if the areas selected for study were representative, and if they were surveyed within a fair degree of completeness. Comparisons of survey figures with data from the agricultural censuses of 1930 and 1935 are included to facilitate judgment of the adequacy of the sampling and whether the results are representative.

When significant census data for the surveyed counties are compared with data from the same source for all counties it is apparent that, in general, the counties reached by the survey were those having smaller acreage and greater value of land and buildings than the average. Otherwise, most of the groups of counties chosen to be studied seem to be reasonably representative of their respective States. Apparent discrepancies in the samples actually obtained, as brought out in further comparisons, are therefore probably due in most of the States to incompleteness of enumeration. It is shown that in only one State, Maryland, the survey covered 100 percent of the occupied houses as reported in the 1935 agricultural census for the sur-

---

[1] The study was a project of the Civil Works Administration and was directed by the Bureau of Home Economics, U. S. Department of Agriculture, with the advice of Mordecai Ezekiel of the Office of the Secretary of Agriculture, and the active cooperation of the Bureau of Agricultural Engineering and the Extension Service.

[2] See appendix, p. 38.

97683°—39

veyed counties, and in only one other State, South Dakota, the coverage equalled 90 percent.

Comparison of survey data with census data for the surveyed counties shows that, in general, the survey is lower than the census in average acres per farm and percentage of owners, higher in average number of occupants per house, and fairly consistent with the census in respect to percentages of houses with white occupants and certain household facilities. The areas surveyed in New England, New Jersey, Florida, most of the Mountain division, and the Pacific division are apparently above the average for the surveyed counties, while those surveyed in the other divisions seem to be fairly representative.

A further means of evaluating the results of the survey is through comparison of survey data with census data for complete States. This type of comparison provides some basis for judging whether the samples obtained in the survey are representative of their respective States. The consistent characteristics of the survey in reporting smaller acreage, fewer owners, and more occupants per house than are shown in the census are again apparent. The high percentages of houses having certain household facilities, particularly electricity, reported in the survey indicate that it represents a higher level of rural housing than the average in most of the States. The conclusion is perhaps warranted that the survey reached more farm homes near towns and cities than in remote rural areas.

The data from the farm-housing survey are presented with the belief that they contain information of permanent value. They provide the largest body of data so far available on rural housing. There is little evidence that rural housing has greatly improved since 1934, except perhaps in respect to the increase of such facilities as electric lights, piped water, and bathrooms, incidental to the rapid extension of rural electrification during these years. The sample is not ideally representative of farming conditions throughout the country, but in the absence of knowledge as to the relative importance of the various factors influencing rural housing, it is adequate in most of the areas surveyed. The survey presents a generalized picture of rural housing in which certain pronounced characteristics stand out, rather than a precise comparison of conditions in different parts of the country. If such comparisons are based on the tables, they should be viewed in the light of practical knowledge of specific areas.

If accidental selection operated in connection with the choice of areas to be studied and the enumeration of those areas, it probably tended to limit the sample to farms accessible to urban influence. Condition of structural parts was determined by local people whose standards were those of their own region. The data on conveniences and equipment are positive—things that the farmhouses actually had.

The average of farm housing in America is probably not so good as it is shown for the farms included in the survey. How much worse it is we do not know.

County and State figures are based on straight summaries. For the divisional and national figures State summaries for all items have been weighted in proportion to the number of occupied farm dwellings reported in the 1935 Census of Agriculture. Figures for the United States do not include the Middle Atlantic division. That is, the national summary is a summary of weighted State summaries, excluding New Jersey. The sample obtained in New Jersey, which was the only State of the Middle Atlantic division entered by the survey, cannot be considered representative of conditions in the whole division.

The index of condition (table 3) is an average of the number of cases reporting good condition for any one of seven structural items, expressed as a percentage of the total number of cases in each geographical unit. The seven items are foundations, exterior walls, roofs, chimneys, doors and windows, interior walls and ceilings, and floors.

TABLE 2.—*Houses surveyed; acreage of farms; distribution of owners, nonowners, white and nonwhite operators; and age and material of houses*

---

[1] Less than 0.1 percent.

[2] Includes all of Camden and Currituck Counties and the following townships of Pasquotank County: Mount Hermon, Nixonton, and Salem.

[3] Total acreage in Bulloch County was reported for owners only.

[4] These Counties were tabulated together.

[5] Includes some Mexicans.

[6] Reservation Indians not included.

[7] Japanese not included.

TABLE 3.—*Size of house, room use, and number of occupants*

---

[1] "More than 1 story" does not necessarily mean "2 story." Houses with lofts were included in this group.

[2] The index of condition is an average of the number of cases reporting good condition for any 1 of 7 structural items, expressed as a percentage of the total number of cases in each geographical unit. The 7 items are foundations, exterior walls, roofs, chimneys, doors and windows, interior walls and ceilings, and floors.

[3] A number of Finnish steam bathhouses, or rooms, were reported, especially in Itasca and Meeker Counties.

[4] Less than 0.1 percent.

[5] Some Russian and Japanese bathhouses included.

TABLE 4.—*Water supply and sewage disposal*

[Expressed in percentage of total number of houses surveyed in each geographical unit]

Division, State, and county	Water supplied to house			Indoor toilets		Bathroom fixtures [1]		Kitchen sink with drain	Septic tank [2]
	Hand pump in dwelling	Piped		Chemical	Flush	Tub	Lavatory		
		Cold	Hot and cold

---

[1] Some bathrooms reported in table 3 had no fixed plumbing equipment.
[2] Occupants sometimes confused septic tanks with cesspools.
[3] Probably includes some ordinary washtubs.
[4] Less than 0.1 percent.

[1] The householder was asked, "Would you be interested in borrowing money to finance construction, repairs, or improvements provided interest rate is satisfactory and repayments can be distributed over a period of 10 years?"

[2] Representing householders who gave a definite negative reply. The percentage of no replies is not given in this table, but it can be calculated from the percentages that are given.

DATA FROM THE SURVEY COMPARED WITH CENSUS DATA

COMPLETENESS OF SURVEY AND ADEQUACY OF SAMPLING

Comparable data from the survey and the agricultural censuses of 1930 and 1935 have been set up in the following tables as a guide to the use of the survey material (tables 8–10).

At the time the farm-housing survey was made there was no approximately complete record of the number of farmhouses in all the various counties studied. A rough estimate could be reached on the basis of the number of farms listed in the 1930 Census of Agriculture. This was the guide used by State and county chairmen in selecting the areas for study. Now, however, the results of the 1935 census on the number of occupied farm dwellings are available.

These two sets of figures are comparable only within certain limits. The farm-housing survey was made in January 1934, and the farm census was taken in January 1935. A number of changes undoubtedly occurred during the 12 months that elapsed between the two enumerations. Furthermore, the census reported all farm dwellings occupied on January 1, 1935, while the survey reported only dwellings that had been inhabited by the same tenants for the past 3 months or would be inhabited by the same tenants for the coming 3 months.

State committees were advised at the beginning of the survey that they could choose their sample either on the basis of whole counties or parts of counties. According to available records, all committees, except those in 15 States,[3] chose whole counties.

The survey was made in every township of the selected counties in 13 States. These States are New Hampshire, Connecticut, Indiana, Missouri, North Dakota, South Dakota, Nebraska, Kansas, Maryland, Georgia, Tennessee, Louisiana, and Arizona. On the basis of information available at the time, the committees in charge of the survey in these States thought that the enumeration was thorough and complete within the townships.

It was reported for Ohio, Michigan, Iowa, West Virginia, Oklahoma, Idaho, Wyoming, Colorado, and Oregon that the enumeration of individual townships was complete, although the complete county sample was not obtained in all instances. In Illinois, Wisconsin, Virginia, South Carolina, Kentucky, Alabama, Arkansas, New Mexico, and Washington the enumeration of some or all townships was not complete.

Fifty counties out of the 308 that are included in the final tables reported over 90 percent of the occupied dwellings as given by the census of 1935 for those individual counties. The following counties included 100 percent or more: Missouri, Maries; South Dakota, Minnehaha; Tennessee, Hardin; Virginia, Essex; Florida, Dade; Maryland, Caroline and Carroll; Utah, Piute and Sevier.

It is not possible to judge the completeness of the enumeration in those counties where some townships were omitted by comparison with census data since the census data on occupied dwellings are not available by townships.

A comparison of agricultural census data for the surveyed counties with data from the same source for all counties gives some indication whether the counties entered by the survey would have provided a representative sample if completely surveyed. Table 8 gives these comparisons in percentages and averages.

---

[3] *Maine:* Androscoggin and Knox Counties complete; parts of 2 towns in Lincoln. *Vermont:* Chittenden, 10 towns; Lamoille, 8 towns. *Massachusetts:* Franklin, 6 towns; Hampshire, 8 towns; Worcester, 11 towns. *Rhode Island:* Certain areas in Kent, Providence, and Washington Counties. *New Jersey:* Middlesex County, and all except 4 townships in the southeastern section of Burlington. *Minnesota:* 7 complete counties, and the western half of Polk County. *Delaware:* 200 farms in each of the 10 divisions of Sussex County. *North Carolina:* 9 counties and the Camden area, comprising Camden and Currituck Counties and a part of Pasquotank. *Florida:* 6 counties, and an area composed of parts of Gadsden and Leon Counties. *Mississippi:* 6 whole counties and 2 areas, 1 comprising parts of Clay and Lowndes Counties and the other, parts of Sunflower and Leflore. *Texas:* 4 precincts in each of 25 counties. *Montana:* 2 counties and 2 areas. Parts of Lake and Flathead Counties were considered 1 area, and parts of Sweet Grass and Wheatland Counties another. *Utah:* 3 areas: (1) Cache County; (2) Weber and Davis Counties; and (3) the Gunnison Valley, including Sevier, and parts of Piute and Sanpete. *Nevada:* The Lahontan Valley in Churchill County, and Truckee Meadows in Washoe County. *California:* Representative townships and precincts in 6 counties. Towns in New England are minor civil divisions similar to townships in other States.

TABLE 8.—*Comparison of agricultural census data for the surveyed counties with agricultural census data for all counties*

As table 8 shows, on the whole the counties were chosen with care and insight. Most of the samples seem to be reasonably representative of their respective States. Apparent discrepancies in the samples actually obtained, as brought out in comparisons to be given later, are therefore probably due in most of the States to incompleteness of enumeration.[4]

In the comparison of average acreage for the surveyed counties with that for all counties, the first item of table 8, it is apparent that on the whole the sample areas had smaller farms than the averages based on all farms for the various States and divisions. The average for all the counties surveyed in the 46 States is 143.5 acres per farm, while the national average is 154.8 acres. The two averages are reasonably close for 15 States; the average for the sample is above that for the State in 12 States; and it is below in 19 States. The groups of sample counties in the Mountain and Pacific States are all low in average acreage except in New Mexico. Because of the large acreage of farms in these Western States the average acreage of the national summary for the surveyed counties would naturally be low.

The percentages of owner-operated farms correspond closely in 32 States. The sample also checks quite satisfactorily with the complete figures for the number of farms with white operators in 36 States.

Three items of household facilities were included in the 1930 Census of Agriculture and not in the 1935 enumeration. These are: Water piped into farmer's dwelling house, Water piped into bathroom, and Farmer's dwelling house lighted by electricity. Since no other figures on these items are available, they have been used in evaluating the survey, although 4 years elapsed between the 1930 census and the farm-housing survey. There is no evidence that farm housing improved during those 4 years. The most important change was probably deterioration of both structure and equipment; therefore the incidence of such facilities as electric lights, piped water, and water in bathrooms probably remained fairly stationary.

The sample counties of 27 States correspond with the respective States in percentage of farmhouses lighted by electricity. The samples of 31 States are in agreement with State percentages on piped water. For 36 States there is agreement between sample counties and all counties in respect to percentage of dwellings having water piped into the bathroom.

The final comparison in table 8 is between the average value of land and buildings in the surveyed counties and the average value of land and buildings for all farms in the various States in 1935.

The value of land and buildings of the sample counties in general is higher than that for the States. The sample is low in value, however, in the New England and Pacific divisions. In only six States are the two averages of value of land and buildings within $100 of each other.

Table 8 indicates that for most of the States the counties reached by the survey were those having smaller acreage and greater value than the average. The sample counties seem to be reasonably representative in respect to ownership, percentage of white operators, number of farms with electric lights in the dwellings, piped water and water piped into bathrooms. If the items listed in this table are truly significant of housing conditions, a few samples seem to be conspicuously above or below the average for their respective States. The samples from Massachusetts, Connecticut, and Delaware might be expected to present a picture of farm housing considerably below the conditions obtaining generally in these States; while the picture presented in Indiana, South Dakota, Florida, Kentucky, and Utah should probably be better than the average. The two counties selected in New Jersey are definitely above the economic level of the Middle Atlantic division and cannot be used as a sample for that whole division. The Arizona, Nevada, and California samples are also unrepresentative, according to table 8. The Arizona sample is low in respect to average size of farms, percentage of ownership, whites, and household facilities, and very high in respect to average value of land and buildings. The Nevada and California samples are low in acreage, high in household facilities, but very low in average value of land and buildings.

From table 8 it is apparent that the sample counties, if they had been completely covered by the survey, would have given a fairly representative sample of the whole country as far as can be judged from agricultural census data. The number of occupied farmhouses enumerated in the survey equaled the number of occupied houses reported in the agricultural census for 1935 in only one State, Maryland. South Dakota is the only other State in which the coverage, according to the census, equaled 90 percent. Therefore, in evaluating the survey sample, it becomes necessary to compare the survey data with data from the agricultural census for the surveyed counties. Table 9 gives such comparisons of pertinent items.

---

[4] The discarding of county tabulations from a few States because of mechanical errors undoubtedly disturbed the balance of the original samples. This, however, would be apparent in table 8, as the discarded counties are not included in any of the summaries of surveyed areas.

TABLE 9.—*Comparison of farm-housing survey with agricultural census data for the surveyed counties*

Division and State	Average size of farm			Owner-operated farms			Farms with white operators			Houses reported as having [1]— Electric lights		Houses reported as having [1]— Piped water		Houses reported as having [1]— Bathtubs		Average number of occupants per house

---

[1] The survey figures are based on number of houses, while the census figures are based on number of farms.
[2] Home plants and power-line connections.
[3] Water piped into bathroom.

An inspection of table 9 shows that the survey is lower than the census in respect to average acreage per farm and percentage of owner-operated farms, high in respect to average number of occupants per house, and fairly consistent in respect to the percentages of white operators, and household facilities. The figures on acreage agree approximately for only 13 States, and those on ownership for 17 States. The total of approximate agreements on white operators is 41 States; on electric lights, 20 States; on piped water, 25 States; and on water piped into bathrooms, 25 States. (The survey figures on bathtubs were used with census figures on water piped into bathroom for this last comparison.)

The worst discrepancies in acreage occur again in the Western States, where the largest farms are found. The survey shows a larger average acreage than the census for only six States: Virginia, North Carolina, Kentucky, Mississippi, Arkansas, and Texas.[5] These are all States in which tenancy is common. It is possible that in some cases acreage was reported by both owners and tenants, thus raising the total acreage and possibly the average of those reporting acreage. However, the Kentucky sample may include too many of the rich bluegrass areas characterized by large farms to be typical. For North Carolina, Mississippi, and Texas, where parts of counties were combined to be surveyed as representative areas, it is impossible to make an exact comparison between total survey and census figures on acreage, as the survey data are available only in county or "area" units.

In only one State, Mississippi, did the survey enumerate a higher percentage of owners than the census. The most conspicuous discrepancies are in Maryland, West Virginia, New Mexico, and Arizona, where the census reports of owner-operated farms exceed the survey by 10 percent or more.

The agreement between survey and census figures for the surveyed counties on white operators is satisfactory in all States except Maryland and Georgia, in which the survey reports fewer whites than the census, and Mississippi, Arizona, and Nevada, in which the survey reports more whites than the census. The Mississippi sample is apparently above the rest of the State in size of farms, ownership, and proportion of white operators; but the discrepancy in Arizona and Nevada is largely due to the fact that the Indian reservations were not enumerated.

Although it is obvious that size of farms and tenure and color of operator influence the type and condition of rural housing in any given area, the relative weights of these factors are not known. Furthermore, other less tangible factors seem to be important, such as length of settlement of the region, cultural traditions of the people, and climate. Therefore, the most important available test of the survey data is perhaps the comparison of survey figures on electric lights, piped water, and bathtubs with the 1930 census figures on household facilities. These comparisons show that the areas surveyed in New England, New Jersey, Florida, most of the Mountain division, and the Pacific division are probably above the average for the surveyed counties, and that the samples in the other divisions are fairly representative.

However, the apparent bias is not so clearly localized in respect to water piped into the dwelling. The sample results for New Jersey, Florida, Arizona, Utah, Nevada, Washington, Oregon, and California are above the census figures for this item, but there are 10 States for which the survey reported appreciably fewer farms with piped water than the census. These are all the New England States, except Vermont and Rhode Island; Ohio, Indiana, North Dakota, Nebraska, Kansas, and West Virginia.

There is a possible explanation of this inconsistency in the fact that for all these States except West Virginia, where the discrepancy between survey and census figures is only 4 percent,[6] the survey reported hand pumps in more than 20 percent of the houses. A higher percentage of hand pumps in the dwellings was reported in the survey generally for the New England and Central States than for the rest of the country. This item was enumerated separately from piped water in the farm housing schedule, while the agricultural census is thought to have enumerated some hand pumps in the dwellings as piped water.[7] Therefore, the census would probably report a higher percentage of piped water in those States where hand pumps are common.

The general characteristics shown by the survey of smaller acreage, smaller proportion of owners, more household facilities, and more occupants per house than were reported in the agricultural census, suggest that the survey enumerated the more thickly populated parts of the various counties on or near good roads and served with electric power. Such areas are more accessible to urban influence than the outlying regions and would reflect a higher standard of housing. It is highly probable that the more inaccessible farms were neglected in those counties where the coverage was not complete because of the difficulty of finding such farms and the bad condition of unpaved roads at the time the survey was made.

REPRESENTATIVITY OF RESULTS

The previous analytical tables have been prepared to facilitate evaluation of the probable adequacy of the sample included in the farm-housing survey. The emphasis in table 9 is upon comparisons between survey data obtained in the sample areas and census data from the groups of counties composing the sample areas. In order to judge whether the results of the survey are actually representative of conditions in the various States and divisions as a whole, according to the original design of the study, similar comparisons should be made between survey data and the census figures for complete States and divisions. Table 10 has been organized on this basis.

---

[5] That is, the survey average is above the census average for both 1930 and 1935.

[6] In the interpretation of the tables of census comparisons, a latitude of agreement of 5 acres was allowed in average acreage (except in the far western States, where a greater latitude was occasionally allowed), and 3.5 percent in the other comparisons.

[7] Fifteenth Census of Agriculture, vol. IV, p. 533. "The wide difference between the farms reporting 'water piped into dwelling,' and those reporting 'water piped into bathroom,' may be partly due to the inclusion of hand-operated pumps without accompanying storage tanks, installed in houses for pumping water direct from wells."

---

[1] The survey figures for the United States and the divisions are weighted. Those for the States are not.
[2] The survey figures are based on number of houses, while the census figures are based on number of farms.
[3] Home plants and power-line connections.
[4] Water piped into bathroom.

In table 10 the characteristics of the survey of more occupants, smaller acreage,[8] and fewer owners than the census reports are more pronounced than in the other tables. Forty-four States still report a larger average number of occupants per house for the survey than the census. Nine States are nearly in agreement for the survey and the census on acreage. Ten States report a greater average acreage for the survey than the census, but 27 States report a smaller average acreage. The discrepancy is greatest in South Dakota, Nebraska, and the Mountain States. Only two States, Delaware and Mississippi, report an appreciably higher percentage of ownership for the survey than the census. Twelve States show an approximate agreement, and in 32 States the survey percentage is below that of the census. The agreement on percentage of white operators is fairly close for 35 States. The survey is above the census in respect to this item in six States and below in five.

The survey undoubtedly enumerated areas with a higher percentage of electrification than was general at that time. Thirty-two States of the 46 that were surveyed reported more electric lights in the survey than were reported in the census. Only two States, Connecticut and Arizona, show fewer electric lights in the survey than in the census, and in 12 States the survey and the census are in reasonable agreement on this point. The survey figures on electric lights are conspicuously high in New England, with the exception of Connecticut, in New Jersey, Michigan, Wisconsin, Florida, Montana, New Mexico, Utah, Nevada, Washington, Oregon, and California.

There is satisfactory agreement between survey and census figures on piped water in 25 States. The survey figures for 15 States are high. Those for South Dakota, Florida, Texas, New Mexico, Arizona, Utah, Nevada, and California are conspicuously high. In only six States were significantly lower percentages of piped water reported in the survey. These are Ohio and all the New England States except Rhode Island.

In 22 States there seems to be fairly close agreement between bathtubs as reported in the survey and water piped into bathroom as reported in the census. Arizona is the only State in which the survey shows a noticeably smaller percentage than the census. Twenty-three States are higher for the survey than the census, with the following States exceeding the census by 10 percent or more: Rhode Island, New Jersey, Florida, Utah, Nevada, and California.

Table 10 offers more evidence that the farm-housing survey enumerated areas within States where housing was above the average for the respective States. The small average acreage shown by the survey is not necessarily conflicting evidence because smaller farms are generally found near cities and towns where the urban influence is felt in rural housing. It is also possible that the smaller percentage of ownership shown by the survey is due to its apparent bias in favor of accessible farms. The high percentages for household facilities reported in the survey indicate that the sample obtained is above the general level of rural housing in New England, with the exception of Connecticut, in New Jersey, all the East North Central division except Ohio, most of the West North Central States, Florida, Kentucky, Texas, most of the Mountain States, and the Pacific division. (It has been pointed out that the inconsistency shown by the survey in the New England States in reporting less piped water than the census may be due to the custom of having hand pumps inside New England dwellings.)

The several tables included in this discussion have been designed to assist users of the survey material in judging the adequacy of the material for various purposes. Obviously the material is more adapted to some purposes than others, and it is impossible to set up a standard by which to pass final judgment individually on the 46 States. However, some State samples do stand out as being decidedly more or decidedly less representative of their respective States than the others.

In such an evaluation all comparisons with census figures included in tables 8, 9, and 10 must be considered in relation to each other: Comparison of census averages and percentages for surveyed counties and all counties as given in table 8; comparison of survey and census figures for the surveyed counties as given in table 9; and comparison of figures for the survey samples with census figures for all counties, as given in table 10.

The least representative samples seem to have been obtained in the New England, Mountain, and Pacific States.

Connecticut and Arizona are the only two States in which the survey results seem to be consistently below the State averages.

The New Jersey sample is well above the census figures for both the State of New Jersey and for the Middle Atlantic division.

In South Dakota the survey seems to be representative of the surveyed counties but above the State average.

With the exception of Ohio, where the survey got a fairly representative sample, the East North Central States are a little high in value of land and buildings and in household facilities.

The Florida sample, according to these comparisons, is also above the State average. The census reported a higher percentage of electric lights for the surveyed counties in Florida than for the State, and the average value of land and buildings for the surveyed counties was $1,830 higher than that for the State. The survey reported considerably more household facilities than the census reported for the surveyed counties or the State.

In the Mountain division, New Mexico, Utah, and Nevada are very high in respect to household facilities, although the average value of land and buildings for the surveyed counties in Nevada was $2,412 below the average for the State.

The Arizona sample is particularly unrepresentative, according to the comparisons that have been made in these tables. Only one county, Pinal, was surveyed. According to census figures for that county, it was below the State in every respect considered in this discussion except value of land and buildings, which was $1,493 above the State average in 1935. The survey reported a much higher percentage of white persons, electric lights, piped water, and bathtubs for the county than the census, but not enough lights and tubs to equal the census figures for the State. The discrepancies between survey and census figures for Arizona are partially due to the fact that Pinal County has a large Indian population on three reservations which were not enumerated by the survey. The fact that the average number of acres per farm in Pinal County jumped from 382.5 in 1930 to 631.9 in 1935 indicates a rapid economic change which would have an unpredictable effect on farm housing.

---

[8] The survey figures on acreage are probably less reliable than those of the census for three reasons: (1) The necessity for accurate enumeration of this item was not emphasized, as acreage was merely correlative to the main purpose of the study, (2) all enumerators were women, (3) many of the interviews were with housewives rather than with the farm operators.

The survey figures for Washington, Oregon, and California seem to represent a higher standard of rural housing than is general in those States, in spite of the fact that the value of land and buildings for the surveyed counties is in each instance lower than the State average, and in California it is $4,487 below the State average. It is probable that in all these Western States, including the Mountain States, the survey largely represents irrigated regions, and other areas of intensive farming, to the neglect of the more remote areas where the farms are larger but household facilities are less common.

The results from 10 States seem to be as reliable as could be expected when evaluated by means of comparisons with data from the agricultural census. These 10 States are Ohio, Minnesota, North Dakota, South Carolina, Georgia, Tennessee, Alabama, Arkansas, Oklahoma, and Colorado.

Results from the other 36 States apparently vary in their approximation of actual conditions. However, the survey does show the same pronounced regional characteristics as the census in respect to comparable items. The variation between the survey and the census seems to be a matter of degree of difference, rather than one of contradictory facts. The survey cannot be used as a precise instrument, but it probably gives a fairly true picture of rural housing in the 46 States, with important differences and likenesses clearly defined.

APPENDIX

THE SCHEDULE AND ITS USE

The schedule was designed as a check list to avoid the necessity for involved definitions and to minimize the danger of interpolations by enumerators. The section on condition of the house, and the judgments of needed repairs and alterations or new installations are necessarily subjective. The results for these items of the schedule are therefore not uniform. In some instances the judgment was the enumerator's, sometimes it was that of the person being interviewed, and sometimes it was a combination of the opinions of both. In some counties a minimum standard was set up by which needs were measured. For this reason the tabulations of needs for repairs, alterations, and new installations are not included in the present tables. The effect of differing points of view was not so great in the judgment of condition for three reasons: (1) A rough definition of "good," "fair," and "poor" was given in the instructions; (2) it was possible to set up standards of condition; and (3) the judgment of condition was always given by a local person, whether enumerator or farmer, and was therefore according to local standards. It is probably safe to say that the conditions reported for all counties represent the standards of those counties. They are in all cases judgments by local people, although they are perhaps somewhat biased by the opinion of the enumerators, who, in many cases, were more accustomed to urban standards of housing than were the farmers.

The schedule provided less opportunity for variation in its taking than most, but it is unfortunate that provision was not made for reporting the absence of many items in order that a distinction might have been made in tabulation between lack of such items and failure on the part of the enumerator to report them.

Answers to the questions on financing were influenced by many factors, such as the attitude of the enumerator, the farmer's education, his economic status, rumors regarding the possibility of Government aid in rural housing, local sentiment toward such aid, and local economic conditions. Table 7 on willingness to borrow money is offered because of its intrinsic interest in view of the above conditions, and for its positive value in offering still another proof of the conservatism of rural people.

FARM HOUSING SURVEY

House No. (1)__________ County__________
Date__________ State__________
Township__________

A

Name of occupant__________ Post-office address__________
White (2)__________ Negro, Indian, or other nonwhite (3)__________
House owned (4)__________ Not owned (5)__________ Name of owner__________
Post-office address of owner__________
Total acres in farm (6)__________ Acres tillable (7)__________

B. HOUSE—GENERAL INFORMATION

Kind: Log (1)__________ Earth (2)__________ Frame { unpainted (3)__________ painted (4)__________ stucco (5)__________
Brick (6)__________ Stone (7)__________ Concrete (8)__________
Age of house: Under 10 years (9)__________; 10 to 24 years (10)__________
25 to 49 years (11)__________; 50 and over years (12)__________
One story (13)__________ More than one story (14)__________
Size: Total number of rooms (15)__________ Total number of rooms not in use at any time of year (16)__________ Total number of regular occupants (17)__________.

C. CONDITION OF HOUSE

	Present Condition			Repairs or alterations needed	Replacement or new installation needed
	Good	Fair	Poor		
Foundation	(1)	(2)	(3)	(4)	(5)
Walls, exterior	(6)	(7)	(8)	(9)	(10)
Roof	(11)	(12)	(13)	(14)	(15)
Chimneys	(16)	(17)	(18)	(19)	(20)
Doors and windows	(21)	(22)	(23)	(24)	(25)
Screens	(26)	(27)	(28)	(29)	(30)
Paint, exterior	(31)	(32)	(33)	(34)	(35)
Interior walls and ceiling	(36)	(37)	(38)	(39)	(40)
Floors	(41)	(42)	(43)	(44)	(45)
Stairs	(46)	(47)	(48)	(49)	(50)
Insulation	(51)	(52)	(53)	(54)	(55)

D. SPACE REQUIREMENTS

	Have now	Additional room needed
Bedrooms	(1) No. --	(2) No. --
Living room	(3)	(4)
Dining room	(5)	(6)
Kitchen	(7)	(8)
Workroom	(9)	(10)
Washroom for farm help	(11)	(12)
Bathroom	(13)	(14)
Halls	(15)	(16)
Basement	(17)	(18)
Closets	(19) No. --	(20) No. --
Front or side porch	(21)	(22)
Back porch	(23)	(24)
Storage space for fresh fruits and vegetables	(25)	(26)

E. WATER SUPPLY AND SEWAGE DISPOSAL

	Have now	Repairs or alterations needed	New installation needed
Source of water:			
Well, drilled or driven	(1)	(2)	(3)
Well, dug or bored	(4)	(5)	(6)
Spring	(7)	(8)	(9)
Cistern	(10)	(11)	(12)
Stream	(13)	x x x	x x x
Water supply for house:			
Carried (distance (14) ------ ft.)	x x x	x x x	x x x
Hand pump in dwelling	(15)	(16)	(17)
Piped, cold	(18)	(19)	(20)
Piped, hot	(21)	(22)	(23)
Sanitary facilities:			
Outdoor toilet (privy):			
Improved	(24)	(25)	(26)
Unimproved	(27)	x x x	x x x
Indoor:			
Chemical	(28)	(29)	(30)
Flush	(31)	(32)	(33)
Bathroom fixtures:			
Tub	(34)	(35)	(36)
Shower	(37)	(38)	(39)
Lavatory	(40)	(41)	(42)
Kitchen sink with drain	(43)	(44)	(45)
Disposal of sewage:			
Septic tank	(46)	(47)	(48)
Cesspool	(49)	(50)	(51)
Stream	(52)	(53)	(54)
Surface	(55)	x x x	x x x

F. LIGHT AND HEAT

	Have now	Repairs or alterations needed	New installation needed
Lighting:			
Kerosene or gasoline lamps	(1)	x x x	(2)
Acetylene	(3)	(4)	(5)
Piped gas	(6)	(7)	(8)
Electric:			
Home plant	(9)	(10)	(11)
Power line	(12)	(13)	(14)
How far is nearest power line? (Distance (15)__________miles)	x x x	x x x	x x x
Heating:			
Fireplaces	(16)	(17)	(18)
Stoves	(19)	(20)	(21)
Circulating heater	(22)	(23)	(24)
Pipeless furnace	(25)	(26)	(27)
Piped warm air, steam, or water furnace	(28)	(29)	(30)

G. REFRIGERATION, LAUNDRY, AND COOKING FACILITIES

	Have now	Repairs or alterations needed	New installation needed
Refrigeration:			
Ice	(1)	(2)	(3)
Mechanical	(4)	(5)	(6)
Laundry:			
Where done:			
Out-of-doors	(7)	x x x	x x x
In kitchen	(8)	(9)	(10)
In basement	(11)	(12)	(13)
In special room on same level with kitchen	(14)	(15)	(16)
Equipment:			
Fixed tubs	(17)	(18)	(19)
Power machine	(20)	(21)	(22)
Hand machine	(23)	(24)	(25)
Cooking facilities:			
Wood or coal stoves	(26)	(27)	(28)
Kerosene or gasoline stove	(29)	(30)	(31)
Gas stove	(32)	(33)	(34)
Electric stove	(35)	(36)	(37)

H. LANDSCAPING OF HOUSE

	Have now	Repairs or alterations needed	New installation needed
Yard:			
Surface drainage away from house	(1)	(2)	(3)
Lawn established	(4)	(5)	(6)
Plantings	(7)	(8)	(9)
Walks and drives	(10)	(11)	(12)
Fences	(13)	(14)	(15)

I. RELATIVE IMPORTANCE OF REPAIRS AND IMPROVEMENTS WANTED

Were the following specified amounts available for improving your home, what would you spend them for?

	$500	$250	$100
House repairs and improvements:			
Foundation	(1)	(2)	(3)
Exterior walls	(4)	(5)	(6)
Roof	(7)	(8)	(9)
Chimneys	(10)	(11)	(12)
Doors, windows, screens	(13)	(14)	(15)
Porches	(16)	(17)	(18)
Interior walls, ceilings, floors	(19)	(20)	(21)
Additional room	(22)	(23)	(24)
Water system	(25)	(26)	(27)
Sanitary facilities	(28)	(29)	(30)
Lighting system	(31)	(32)	(33)
Heating system	(34)	(35)	(36)
Bathroom equipment	(37)	(38)	(39)
Laundry facilities	(40)	(41)	(42)
Cooking facilities	(43)	(44)	(45)
Landscaping	(46)	(47)	(48)
Electricity:			
Home plant	(49)	(50)	(51)
Power line	(52)	(53)	(54)
Built-in equipment	(55)	(56)	(57)
Furnishings	(58)	(59)	(60)

J. NEW CONSTRUCTION AND FINANCING

Is construction of new house contemplated within next 3 years? (1)-------- If so, number of rooms (2)---------- Estimated expenditure (3)-- Give value of repairs or improvements made on the present house during the last 3 years: Less than $100 (4)--------; $100 to $499 (5)--------; $500 and over (6)-------- Expenditure for repairs or improvements contemplated within next 12 months (7) $-------- Is money available from local credit sources to finance house construction, repairs, or improvements (8)-------- Would you be interested in borrowing money to finance construction, repairs, or improvements provided interest rate is satisfactory and repayments can be distributed over a period of 10 years? (9) Yes--------; (10) No-------- How much would you desire to borrow? (11) $---------- What would you consider a satisfactory rate of interest? (12)--------------------

DEFINITIONS AND INSTRUCTIONS

General directions to enumerators read as follows:

"When you approach the farm home, tell first the purpose of the survey and state that it is under the direction of the Civil Works Administration, and the Department of Agriculture, Bureau of Home Economics, and Extension Service. If possible, get both the farmer and his wife to answer the schedule questions together. If this is impossible, obtain the information from one of them or from the person in the home who seems best qualified to give it.

"In planning the day's work, start down the road and stop at every farmhouse, including those occupied by tenants and hired help. Detailed definitions for a farm and farmhouses will be found under 'Definitions.' If you fail to find people at home, plan to stop at the same house on your next day's trip; or, if for any reason you have failed to get all the needed information, plan to stop again later.

"In filling in answers on the schedule, use a checkmark (✓) for 'yes.' Leave blank space for 'no.' Use a pencil in filling out the schedule during the interview, and fill in with ink at the end of the day after you have carefully gone over the schedule once more. Be sure that checkmarks are entered opposite the item, so that there will be no questions regarding the interpretation of the schedule by the county tabulator. It is considered that a fair day's work will result in from six to ten schedules."

Enumerators were also told, "A part of a schedule is no schedule. Get complete information. Make a second visit if necessary."

Definitions applying to the parts of the schedule covered in the present tables follow:

"Farmhouses" are to be interpreted as dwelling houses on farms of three acres or more where the occupant secures the major portion of his living from farming. Houses occupied on farms by tenants or hired help are to be included. The definition of a farm is the same as the census definition: "A 'farm' for census purposes, is all the land which is directly farmed by one person, either by his own labor alone or with the assistance of members of his household or hired employees. The land operated by a partnership is likewise considered a farm. A 'farm' may consist of a single tract of land or of a number of separate tracts, and those several tracts may be held under different tenures, as when one tract is owned by the farmer and another tract is rented by him. When a landowner has one or more tenants, renters, or managers, the land operated by each is considered a farm. Thus on a plantation the land operated by each cropper or tenant was reported as a separate farm, and the land operated by the owner or manager by means of wage hands likewise was reported as a separate farm.

"The enumerators were instructed not to report as a farm any tract of land of less than 3 acres, unless its agricultural products in 1929 were valued at $250 or more."

"Total acres in farm"—all land, whether owned or rented, that is operated as a part of this farm unit. Where occupant of house is a hired hand or other tenant who does not operate any land on his own responsibility this space should be left blank, as well as the space after "acres tillable."

"Acres tillable" refers to that part of the total acres in farm which can be plowed in its present condition, whether or not it is now growing cultivated crops.

"Rooms"—living room, dining room, bedroom, kitchen, sewing room, trunk room, playroom, furnace, storage, and recreation room.[1]

"Total number of regular occupants"—to be interpreted as people who have resided in the house within the past 3 months or are anticipating remaining during the coming 3 months.

Condition of house: Good—does not require any repair.
Fair—usable.
Poor—in need of repair; for instance, window with glass out or window that will not shove up and down.

"Foundations"—walls or piers below the first floor, supporting the weight of the building.

"Closets"—storage space for clothing, cleaning equipment, bedding, china, other household articles, canned foods.

"Septic tank"—watertight receptacle with provision for disposal of liquid outflow.

"Piped gas"—natural, manufactured, or compressed tank gas.

"Electric home plant"—gasoline-powered or similar system.

"Power line"—central-station service.

"Pipeless furnace"—one-pipe furnace with large register over heater.

"Piped warm-air furnace"—central furnace with several conductor pipes and register in each room.

"Piped steam furnace"—central boiler circulating steam to radiators in rooms.

"Piped water furnace"—central boiler circulating hot water to radiators in each room.

"Mechanical refrigeration"—electric, gas, kerosene, or chemical.

"Power washing machine"—gas engine, electric motor, or other mechanical power.

"Remarks"—should be filled in by the enumerator giving any unusual circumstances or anything of special interest that would be of value in interpreting the schedule. In no other place in the schedule should any writing be inserted.

Printed tabulation sheets with specific directions for their use were sent to the States and counties from Washington. As the tabulating progressed in the field, warnings were issued against types of errors that were found. The first of these bulletins read, in part, as follows:

"If the survey is to be of value the tabulation sheets and summaries must be absolutely accurate. In tabulating, one person should read from the schedule and a second person should make the entries on a tabulation sheet, using a straight edge to follow both the row and the column on the sheet. Folded paper or a ruler may be used as the straight edge. Two other persons should check the entries made on the tabulation sheet, one reading from the tabulation sheet and the other person looking at the schedule. Be sure that each entry is in the right row and column. Similar precautions should be made in entering the totals at the bottom of the page. For example, on one tabulation sheet a total of 50 was shown for item 25 under section G, 'Laundry equipment, Hand machines.' The total should have been entered in column 26 of this section, which is 'Cooking facilities, Wood or Coal stoves.' "

Later bulletins indicated the various totals that should balance or approximate each other, and gave examples of inconsistencies that had already been discovered in the earlier tabulations.

---

[1] The original definition included bathrooms and halls. Five days after the first instructions were mailed a correction was sent out eliminating bathrooms and halls. Most of the county chairmen reported that corrections for this change were made on all schedules that had been taken, and where necessary, on the tabulation sheets. However, a few bathrooms and halls are probably included in total rooms for all States except New Jersey and South Dakota, which were late in starting.
